

A good catch looks like a quiet week.

I read a whole contract because I had some moments. A teammate had an AI summary of it instead.

The summary had errors nobody could see.

It had hallucinations and errors that would have set back our negotiations. Because I read the source, they were not set back. Nobody reacted.

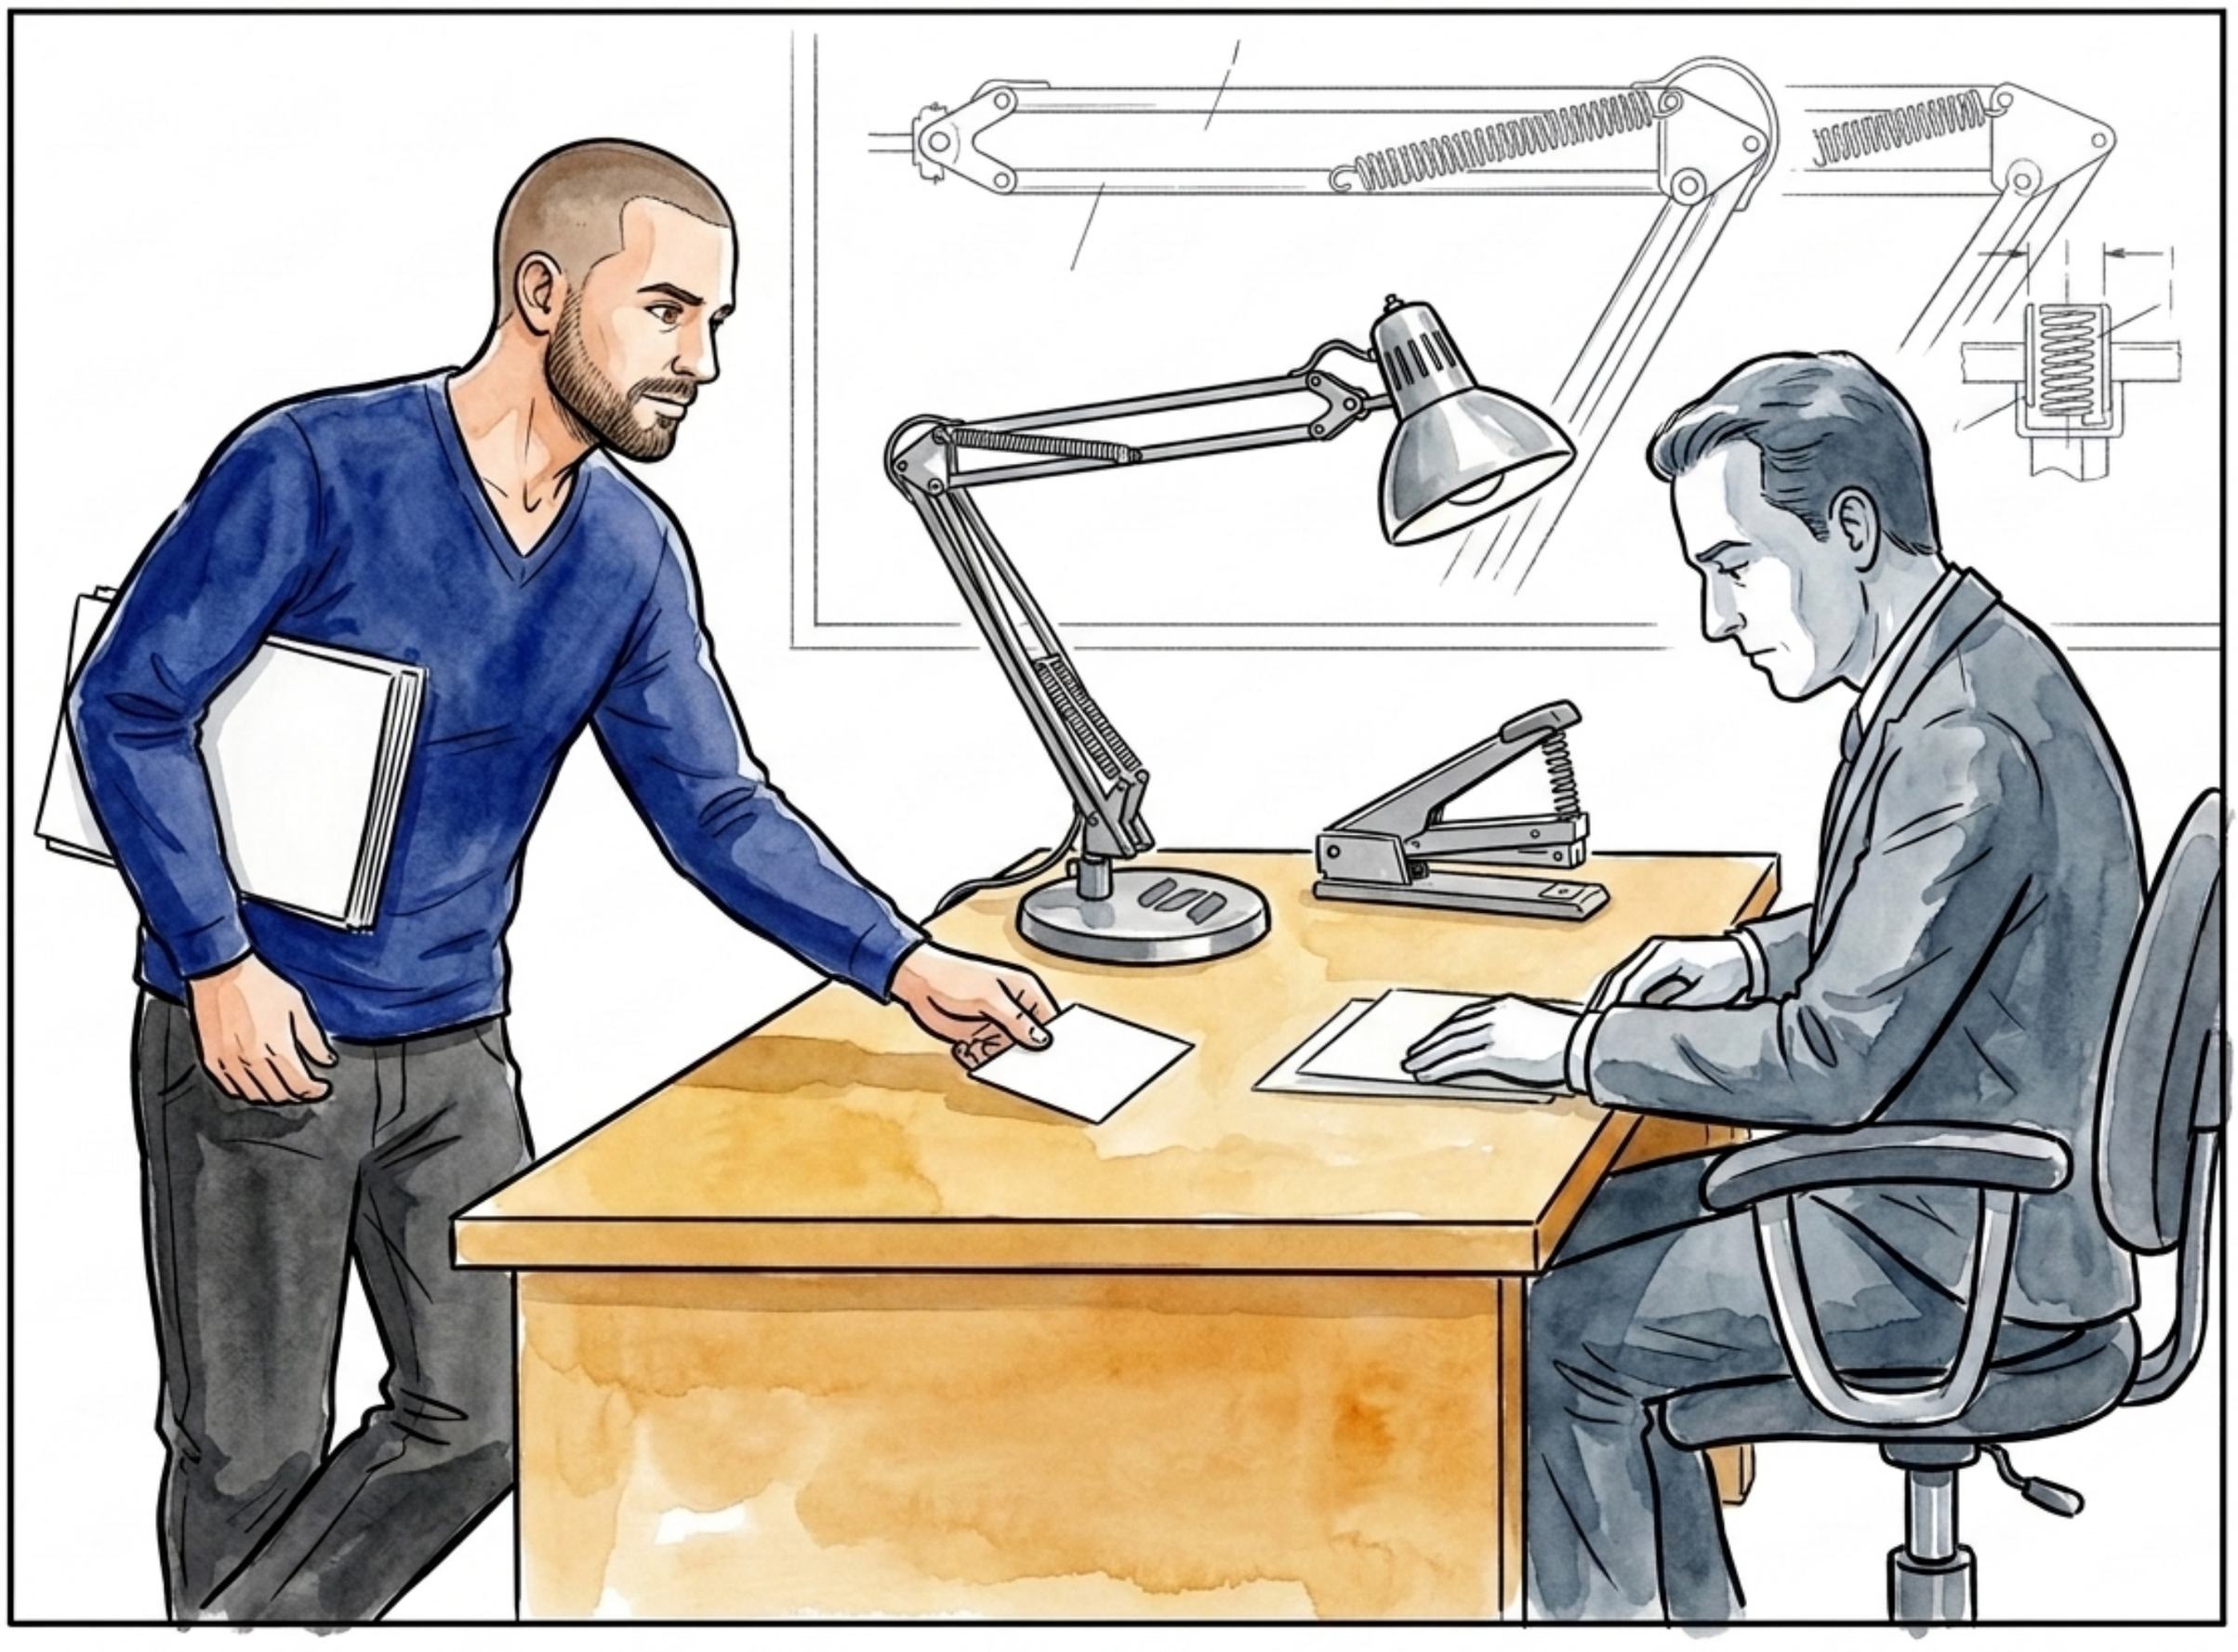

Handled well, the work stays invisible.

Our bug badges before release turned up problems that would have been major after launch. We managed them early, and almost nobody noticed.

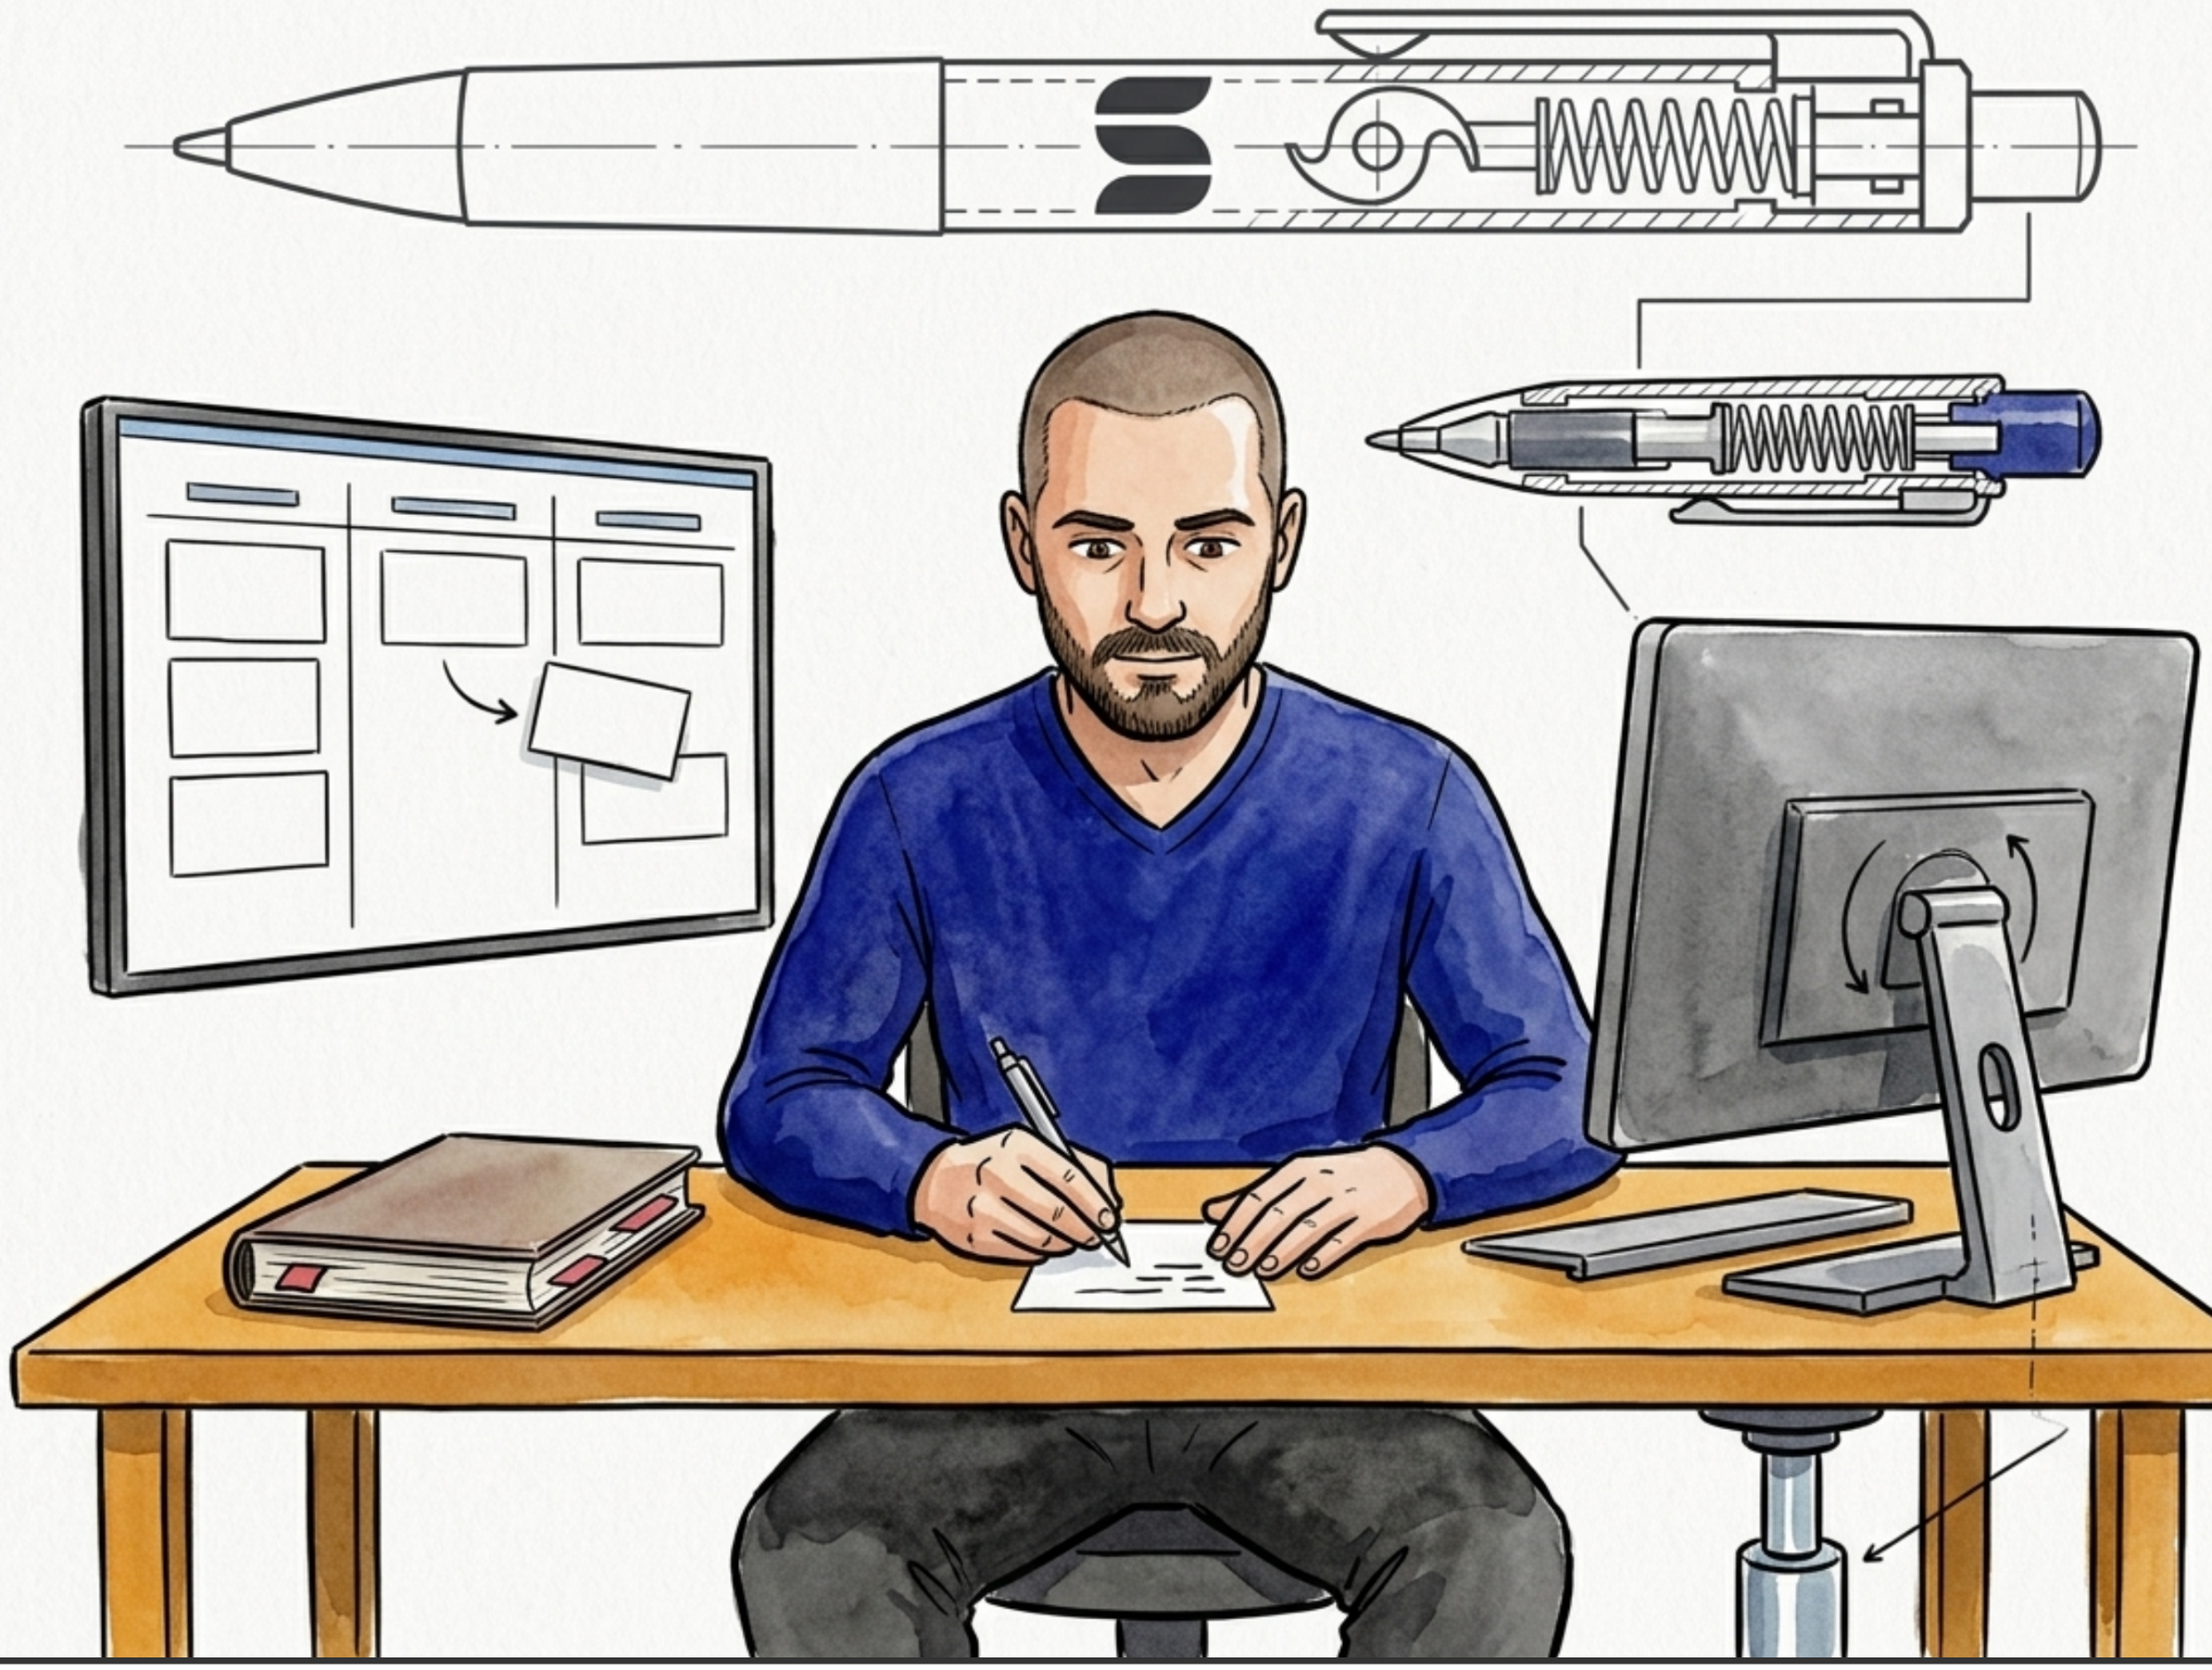

Managers only know what you tell them.

They amplify that message to the people above them. People tend to believe their manager knows everything they do, and it just is not true.

1. Make it about business impact.

Not technical challenge. Give your manager something they can repeat with minimal translation. If they have to decode it first, it stops with them.

2. Name the catch, the cost, the fix.

One line, sent the same day: what you caught, what it would have cost the business, what you did. Write it before you close the ticket.
